Alpha-amylase variants - with improved thermal and oxidation

Alpha-amylase variants - with improved thermal and oxidation

Alpha-amylase variants - with improved thermal and oxidation

T stability and reduced calcium ion dependency

Example 2: 111pp; English.

W12098-W12144 represent alpha-amylase variants of the invention. The

W12098-W12144 represent alpha-amylase sencoding the parent alpha-amylases

C variants of the DNA sequences encoding the parent alpha-amylases

represented by W12955, W12956, R81835 and R81836. W12137-W12140, and

W1213 alpha-amylase shown in R81836. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees

Celcius), and/or oxidation stability, and/or reduced calcium ion

Celcius), and/or oxidation stability, and/or reduced calcium ion

Celcius), and/or oxidation stability, and/or reduced calcium ion

Celcius), and of or oxidation stability, and/or reduced calcium ion

Celcius), and of or oxidation stability, and/or reduced calcium ion

Celcius), and etergent and washing compositions, and for textile desizing.

The alpha-amylase variants can also be used in papermaking and

Celcium of the manylase variants can also be used in the production

Conserved or partiants can also be used in the production

Conserved or cleaved or cleaved or second or conserved or cleaved or cleav
                                                                                                                                                08-APR-1997 (first entry)
Alpha-amylase variant delta183 + delta184 + M202L/I.
Alpha-amylase, detergent; thermal stability; oxidation stability; enzyme; calcium ion dependency; alpha-amylolytic activity; washing composition; textile desizing; papermaking; beer-making; ethanol production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     coxidation stability; enzyme; civity; washing composition; ethanol production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            \mathbf{c}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 483;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            W12115 standard; protein; 483 AA.

**Alpha-amylase variants - with improved thermal and oxidation
stability and reduced calcium ion dependency
claim 9; illipp; English.
**Variants of the invention were created using site directed, or random,
contagenesis of the DNA sequences encoding the parent alpha-amylases
contagenesis of the DNA sequences encoding the parent alpha-amylases
contagenesis of the DNA sequences encoding the parent alpha-amylases
contagenesis of the DNA sequences encoding the parent alpha-amylases
contagenesis of the DNA sequences encoding the parent alpha-amylase
contagenesis of the DNA sequences encoding the parent alpha-amylase
contagenesis of the DNA sequences of the alkaphilic Bacillus
contagenesis of the DNA sequences of the alkaphilic Bacillus
contagenesis of the DNA sequences of the alpha-amylases also
contagenesis of the DNA sequences of substrate. These sequences can be used in detergent and washing compositions, and for textile desizing.
The alpha-amylase variants can also be used in the production
contagenesis of the DNA sequences can be analyzed to the DNA sequences can be used in papermaking and beer-making processes. These variants can also be used in the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Woofstand ussizing; papermanning; beer making; enhance production;

WPI: 96-371423/3.

The property of a contents of the improved a stability and reduced calcium ion dependency stability and reduced calcium. The contents of the invention were created using site directed, or random, contragenesis of the DNA sequences encoding the parent alpha-amylases represented by W12955, W12956, R81835 and R81836. W12098-W12136, W12141, Contents of the alkaphilic Bacillus contraints of the manual stability variants of the alkaphilic Bacillus within NCIB 12512 alpha-amylase shown in R81835. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees Celcius), and/or oxidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylases also contivity with respect to cleavage of substrate, and/or improved specificity with respect to cleavage of substrate. These sequences can content and processes improved stability compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and hear-making processes. These variants can also be used in the production the making processes. These variants can also be used in the production the content of the starch.

RR 209-W12144 represent alpha-amylase variants of the invention. The variants of the invention were created using site directed, or random, uniquenced by W12955, W12956, R81835 and R81836. W12098-W12136, W12141.

W12142 and W12144 are specifically variants of the arapentures in the range of 40-70 degrees Celcius), and/or oxidation stability, and/or reduced calcium ion degreed clouds, and/or reduced calcium ion degreed alpha-amylase also have increased alpha-amylolytic activity (especially at pW values in the range of 80-510.5), and improved binding of a particular substrate. These variant alpha-amylolytic activity (especially with respect to cleavage of substrate. These sequences can be used in detergent and washing compositions, and for textile desizing. The maylase variants can also be used in the production harm washing processes. These variants can also be used in the production harmon the may and the may an

Bacillus sp. alpha amylase.

Alpha amylase; hard surface cleaning; dishwashing; launding Bacillus sp.

12-SEP-1997.

04-MAR-1996; WO-U03276.

(PROC ) PROCTER & GAMBLE CO.

Baeck AC, Jones LA, Ohtani R, Pramod K, Rai S, Showell MS, Ward G;

WPI: 97-457524/42.

Detergent compositions for hard surface cleaning and laur contains Bacillus derived alpha amylase with improved thermostability, reduced calcium ion dependency etc.

Claim 1; Pages 88-89; 97pp; English.

The present sequence is a Bacillus sp. alpha amylase with specific activity at least 25% higher than that of Terman at 25 to 55 degrees C at pH 8 to 10, measured by the Phac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Indels

Thermostability, reduced calcium ion dependency etc.
Thermostability, reduced calcium ion dependency etc.
Thermostability, reduced calcium ion dependency etc.
Thermostability at least 25% higher than that of Termamyl (RTM) at least 25% higher than that of Termamyl (RTM) at 25 to 55 degrees C at pH % to 10, measured by the Phadebas (RT activity test. It is of use in hard surface cleaning, hand or machine dishwashing and laundry at a temperature of 10 to 25 degrees C. Improved cleaning, stain removal and fabric care are degrees C. Improved cleaning, stain removal and fabric care are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
        Apha-amylase variants - with improved thermal and oxidation stability and reduced calcium ion dependency

Stability and reduced calcium ion dependency

Claim 11; illpp; English.

W12098-W12144 represent alpha-amylase variants of the invention. The variants of the invention were created using site directed, or random, mutagenesis of the DNA sequences encoding the parent alpha-amylases

Crepresented by W12955, W12956, R81835 and R81836. W12098-W12136, W12141, W12142 and W12144 are specifically variants of the alkaphilic Bacillus strain NCIB 12512 alpha-amylase shown in R81835. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees Celcius), and/or oxidation stability, and/or reduced calcium ion degrees Celcius), and/or oxidation stability, and/or reduced calcium ion degrees Celcius), and/or oxidation stability, and/or improved binding of a particular substrate. These variant alpha-amylases also possess improved specificity to a particular substrate, and/or improved be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and beer-making processes. These variants can also be used in the production of servences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO9623873-A1.

This alpha-amylase protein is characterized by having a specific activity at least 25% higher than the specific activity of Termamy at 125-55 deg C and a pH of 8-10. The enzyme can be used in detergent composition for starch liquefaction, the production of lignocellulosic materials, e.g. pulp, paper and cardboard from was containing starch, for deinking recycled starch-coated, or starch-containing printed paper, to modify starch for papermaking, for textile desizing, and beer-making processes. This protein may be produced recombinantly.
                                                                                                                                                                                                                                                               textile;

MOL. PHARMACOL. 45:201-211(1994).

CC -1- FUNCTION: RESPONSIBLE FOR THE MANIFESTATION OF PERIPHERAL-TYPE
BENZODIAZEPINE RECOGNITION SITES AND IS MOST LIKELY TO COMPRISE
BINDING DOMAINS FOR BENZODIAZEPINES AND ISOQUINOLINE CARBOXAMIDES.

CC MAY PLAY A ROLE IN THE TRANSPORT OF PORPHYRINS AND HEME.

CC -1- SUBCELLULAR LOCATION: MITOCHONDRION; INTEGRAL MEMBRANE PROTEIN.

CC -1- SIMILARITY: SEGMENTS TM1, TM4, AND TM5 SHOW SIMILARITY WITH THE TRANSMEMBRANE SEGMENTS M1, M2, AND M4 FROM SUBUNITS OF THE GABA(A)/BENZODIAZEPINE RECEPTOR FAMILY, RESPECTIVELY.

REUEGER K.E.;

GENE 121:377-382(1992).

-I- FUNCTION: RESPONSIBLE FOR THE MANIFESTATION OF PERIPHERAL-TYPE

BENZODIAZEPINE RECGNITION SITES AND IS MOST LIKELY TO COMPRISE

BINDING DOMAINS FOR BENZODIAZEPINES AND ISOQUINOLINE CARBOXAMIDES.

MAY PLAY A ROLE IN THE TRANSPORT OF PORPHYRINS AND HEMBE.

-I- SUBCELLULAR LOCATION: MITOCHONDRION; INTEGRAL MEMBRANE PROTEIN.

-I- SIMILARITY: SEGMENTS THI, TM4, AND TM5 SHOW SIMILARITY WITH THE

TRANSMEMBRANE SEGMENTS MI, M2, AND M4 FROM SUBUNITS OF THE

GABA(A)/BENZODIAZEPINE RECEPTOR FAMILY, RESPECTIVELY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         THE THIRD DOUBLEBOND IN THE BIOSYNTHESIS OF 16:3 AND 18:3 FATTY ACID DESATURASE INTRODUCES THE THIRD DOUBLEBOND IN THE BIOSYNTHESIS OF 16:3 AND 18:3 FATTY ACIDS, IMPORTANT CONSTITUENTS OF PLANT MEMBRANES. IT IS THOUGHT TO USE FERREDOXIN AS AN ELECTRON DONOR AND TO ACT ON FATTY ACIDS ESTERIFIED TO GALACTOLIPIDS, SULFOLIPIDS AND PHOSPHATIDYLGLYCEROL.

-1- PATHWAY: POLYUNSATURATED FATTY ACID BIOSYNTHESIS.

-1- SUBCELLULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE).

-1- DOMAIN: THE HISTIDINE BOX DOMAINS MAY CONTAIN THE ACTIVE SITE AND/ OR BE INVOLVED IN METAL ION BINDING.

-1- SIMILARITY: TO OTHER PLANT OMEGA-3 FATTY ACID DESATURASES.

FEBS LETT. 360:191-193(1995).

-1- FUNCTION: RECOGNIZES AND BINDS THE 7-METHYLGUANOSINE- CONT
MRNA "CAP" DURING AN EARLY STEP IN THE INITIATION OF PROTE
SYNTHESIS AND FACILITATES RIBOSOME BINDING BY INDUCING THE
UNWINDING OF THE MRNAS SECONDARY STRUCTURES.

-1- SUBUNIT: EIF4F IS A TRIMER COMPOSED OF EIF4E, EIF4G AND EI

(WHICH CAN CYCLE IN AND OUT OF THE COMPLEX).
